Get in touch

Style	Price	Description
ZERO FADE	$25	Simple back and sides faded hairstyle. The style is created using a combination of scissors and clippers.
RAZER FADE	$25	Sleek back and sides faded hairstyle. The style is created using clippers over whole head without any scissor work.
HIGH FADE	$25	Super sleek back and sides faded hairstyle. This style starts further up the head than the razor fade and zero fade.
BUZZCUT & SIDES	$25	Standard buzz cut and sides all over head without faded style.
LINE UP AND TAPER	$25	Classic line up and taper style hair cut.
STANDARD MENS CUT	$25	A full style cut created using a combination of clippers and scissors. Discounts for seniors and students apply.
HAIR ART AND TRACKS	$25	Hair art and track style haircut. The price is dependant on the detail
BEARD TRIM	$25	Full beard trim or restyle.

COMP710: Assignment 1
Topic: Boss Cuts
By: Timothy Howard | 14405064

Resource's Provided

Note: These pictures were gathered by looking through BossCut's social media pages e.g. Facebook & Google Maps

Description: Purpose

BossCuts managed by Blaine Rakena and his sons have requested a website to be made that provides key features explained below, but more importantly also ropes the viewer into being a customer.

Note: Data displayed below was generated by interviewing Blaine Rakena last year while completing COMP606.

In Scope

- Booking System
- Staff System/Login
- Client Login
- Testimonials - Static
- Data Storage
- Reporting:
- Client Data
- Booking Data

Out of Scope

- Testimonials - Dynamic
- Preview Hair Styles

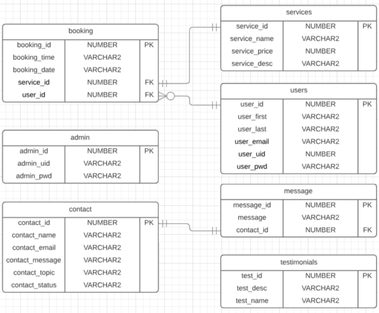
Normalized ERD

BossCuts managed by Blaine Rakena and his sons have requested a website to be made that provides key features explained below, but more importantly also ropes the viewer into being a customer.

Note: Normilization steps have been set and the ERD to the right is the final result.

ERD Tables

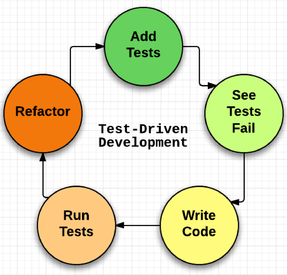
- Booking
- Admin
- Contact
- Services
- Users
- Message
- Testimonials



Initial Design Reviews

Provided in the StoryBoard folder are wireframe mock-ups of our initial designs.
And displayed to the right is one of four reviews we received from our wireframe mock-up.
The rest of the reviews are located in the Review folder.

Note: We have not named any of our reviewers.



Test Driven Development (TDD)

Test driven development (TDD) is a process where tests are written before the code. you start by writing a small test, after you create enough code for the test to pass.
Then you write another test and rinse and repeat, this allows the testability of the code to be built into the software itself.

TDD can be implemented into our project in many different ways.

I believe that one of the best ways to implement this would be to create a shared document where we can break up all the features of the site and create tests for each section.
This will also allow for us to create a development timeline to keep track of our progress and what still needs to be implemented and tested with our site.

Security and Performance Planning
What is Website Performance

In short, website performance testing shows us how a website behaves and responds during various situations. It helps us test the speed and stability of your website systems.

Importance of Page Speed?

In today's tech world, customers expect fast and reliable online user experiences from every website.
If you make them wait for your page to load, they'll most likely visit another website instead because customers generally think load times are slower than they actually are.
This means you need to be doing all you can to make your website load as fast as possible.

For example when developing your content types e.g. file types like images or videos its important to use the latest trends of compression or in my learning using a programmable picture format like SVG as this can support your performance.
Also to the right I've displayed our old pre Laravel BossCuts directory as to figure out and explain improvements that could be made.
When designing your file structure for your webserver you should use different styles of webserver architecture like MVC Model, View, Controller.
This separates the load of the webserver across all valid components.

Importance of Stability?

There will be times when your website has more tra c than normal, and you want to make sure your server can handle the speed and volume of customers.
You should know how many customers your website can handle until it breaks.
That way you can implement the software and website updates necessary to deal with these issues.

Website Security

Website security is the last thing that many people will think about while they're on their website building process.
Even if a security expert is hired in their team, they'll always focus on how and when to put their website live leaving major vulnerabilities undetected or unattended.
Threats like:

Security Threats

- Data breaches
- DDoS attacks
- Backdoor Trojans
- Internet fraud

Basic Fixes

- Data Protection
- Backup User Data

EndUser Improvements

- Use Strong Passwords
- Two-Factor Authorization.
- Always Use Secure Networks
